

Christmas List App Map

Every sign-in path, role, and screen in the family gift-exchange app — from the moment someone opens the link to the moment the Secret Santa draw is saved.

Repo: `jjuhric/christmas-shopping-list` · Reflects `develop` as of the self-service family signup change

01 Who the app thinks you are

Every person is one Firestore document in a single `users` collection. The badges below are the exact ones shown in the Admin Panel's member table, colored to match — they'll recur through the rest of this map.

● Master — first person ever to sign in, sees every family

● Admin — runs one family: invites, edits, removes

● Member — regular adult in a family

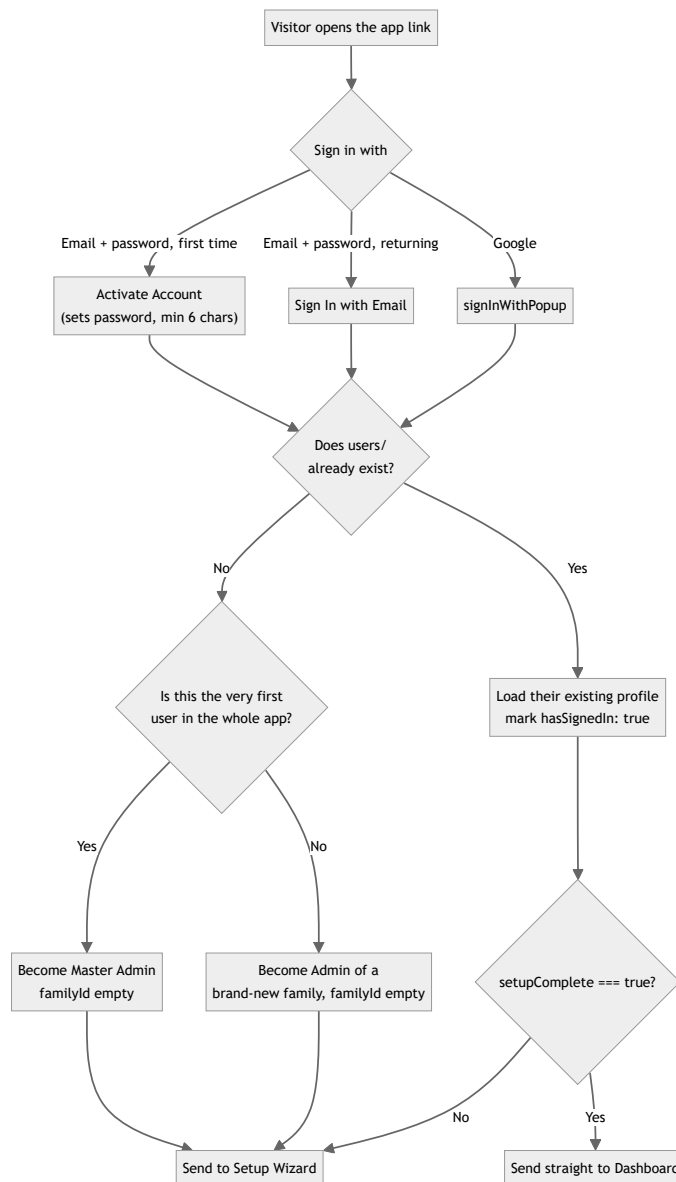

● Extra — tracked on someone's list only, never signs in

● Child — managed profile, no email, no login

Master and Admin are both flagged `isAdmin: true` under the hood — Master additionally carries `isMaster: true`, which is what unlocks cross-family visibility, the draw button, EmailJS setup, and bug reports.

02 What happens when someone signs in

Two credentials lead to the same place: Google, or an email/password activated through the invite flow. What happens next depends entirely on whether that email already has a Firestore profile.

There is no more dead end. Older builds blocked an unrecognized email with "Account Not Found" — now an unrecognized email simply becomes the admin of its own new family.

03 The two starting points

Same login screen, two very different outcomes, depending only on whether Firestore already recognizes the email.

Invited by an admin

An admin already created `users/<email>` for you with a family assigned. Sign in with Google, or use "Activate Account" the first time to set a password. You land in your existing family.

Nobody invited you

No document exists yet for your email. You become the Admin of a brand-new, empty family and are walked through naming it in the Setup Wizard – no gatekeeping.

 **Password field eyeball.** Both the Password and Confirm Password fields on the login screen have an independent show/hide toggle, so you can verify what you typed before submitting – especially useful mid-Activate-Account, where a typo in Confirm Password is the #1 support request.

04 Setup Wizard

Shown any time `setupComplete` isn't `true` yet — first sign-in for everyone, invited or not.
Step 3 only appears for Admins.

1 Your name & family group

Set your display name and the family group name. Everyone in the same group is blocked from drawing each other — the wizard explicitly warns against lumping a whole extended family under one name, since that can make a valid draw impossible.

2 Add a wishlist item or two

Name and an optional link. Helps whoever eventually draws your name. More can be added later from the Dashboard.

3 Invite family members

Add adults (name + email, optionally flagged Admin, optionally sitting out this year's draw) or Child profiles (name only, no email, never part of the draw). Each adult invite tries to send an email via EmailJS.

admin only — members skip straight to step 4

4 Finish

`setupComplete` flips to `true` and you land on the Dashboard from here on.

05 The Dashboard

The home screen once setup is complete. It's built around one running list: everyone in the family you might need to buy a gift for.

"Buy For" list

Combines three sources: your drawn Secret Santa recipient (once a draw has run), every other member of your family, and any "Extra" people you've added yourself — a teacher, a neighbor, a grandparent outside the exchange. Each gets a purchased checkbox.

Your wishlist

Add or remove items any time — visible to whoever draws your name.

View a family member's wishlist

Click any name to open their wishlist in a modal before you shop.

Switch to a Child profile

If you added managed Child profiles, you can switch the active view to shop and track wishlists on their behalf.

Add an Extra person

Name + optional email. With an email, they get their own users document and an invite; without one, they're purely a tracked line item on your list.

Bug report tab

Floating tab on every screen. Captures the page, browser/viewport, and a screenshot, and emails it to the Master Admin.

06 Admin Panel

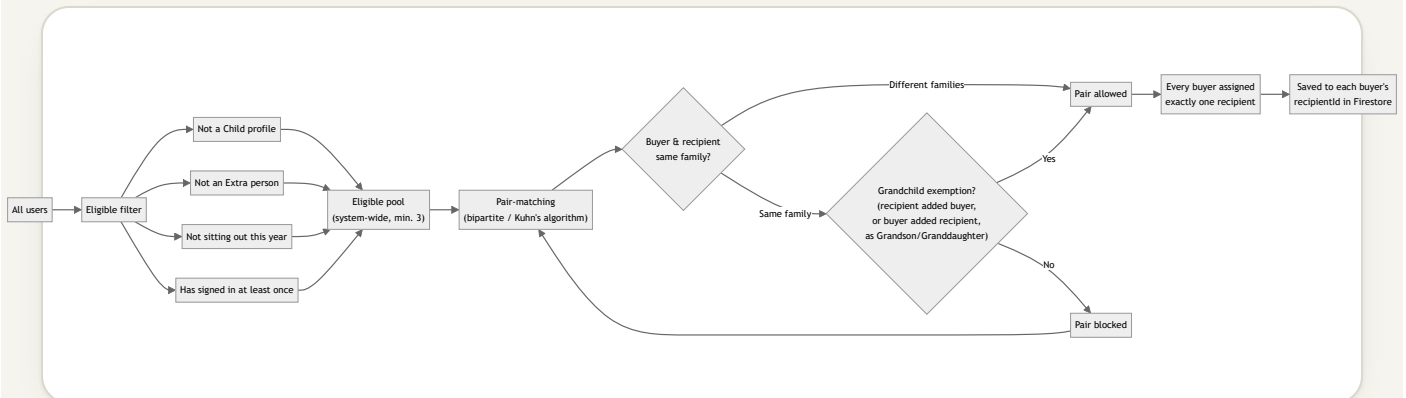

Reachable at /admin by anyone with `isAdmin: true`. What you can act on depends on whether you're a Family Admin (your own family only) or the Master Admin (everyone, plus a few global tools).

ACTION	FAMILY ADMIN	MASTER ADMIN
Add a member to their own family	Yes	Yes
Add a member to any family	—	Yes
Edit a non-admin member's name / email	Same family only	Any family
Edit their own profile	Yes	Yes
Delete a non-admin member	Same family only	Any family
Delete an Admin or the Master	Never	Any Admin, never self
Resend a member's invite email	Yes	Yes
Send a password-reset email	—	Yes
Filter the member table by family	—	Yes
Run the Secret Santa draw	—	Yes, needs 3+ eligible
Configure EmailJS keys	—	Yes
View / clear bug reports	—	Yes

A Family Admin can never see or touch another family's admin accounts at all — they're filtered out of the table entirely, not just grayed out.

07 The Christmas Shopping List draw

Master Admin only, triggered from the Admin Panel. Every eligible person is guaranteed exactly one recipient and exactly one buyer – this isn't a random shuffle-and-hope, it's matched so a valid arrangement is found whenever one exists.

Eligibility is evaluated across every family at once – the "3 people minimum" is a system-wide count, not per family.

The grandchild exemption. Relation is normally irrelevant – the only rule is "different family." But if someone's relation is set to Grandson/Granddaughter, they're exempted from the same-family block specifically with the grandparent who added them, and nobody else in that family group – not even their own parent, if the parent shares the group.

Re-running the draw overwrites every existing `recipientId`. The Admin Panel warns before any member removal if a draw has already happened, since pulling someone out mid-exchange can strand their buyer or recipient.

08 Where the code actually lives

Two branches, two live URLs, one shared GitHub Pages site — pushing to one never disturbs the other.

PRODUCTION

Live for the family

`jjuhric.github.io/christmas-shopping-list/`

What you send to relatives. Only updates when a change is merged into `main`.

Trigger: push to `main`

DEVELOPMENT

Safe to break

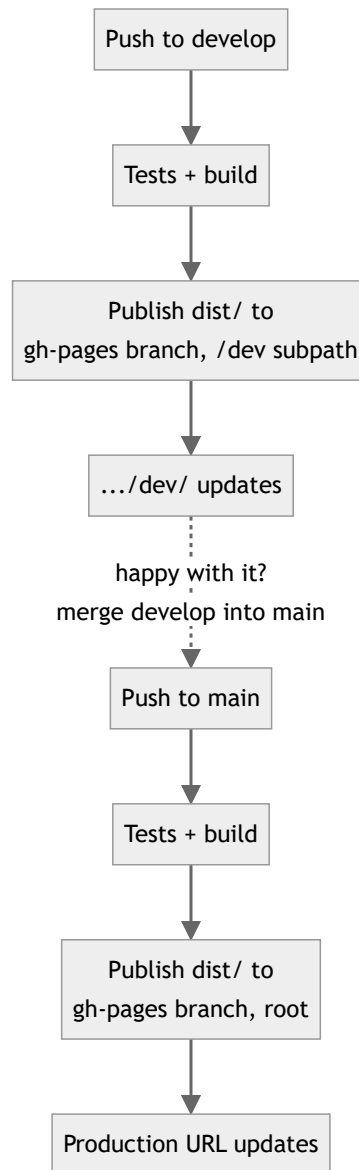

`jjuhric.github.io/christmas-shopping-list/dev/`

Mirrors whatever is on `develop`. Test new features here first — production is untouched until you merge up.

Trigger: push to `develop`

09 How a push turns into a live update

Both environments run the same pipeline – tests, build, publish – and each only touches its own corner of the same gh-pages branch.

Each deploy only touches its own subpath (`keep_files: true`), so a dev push can never overwrite production and vice versa. The normal workflow: build and test on develop, check it at `/dev/`, then merge to main when it's ready for the family.
